LemurGo

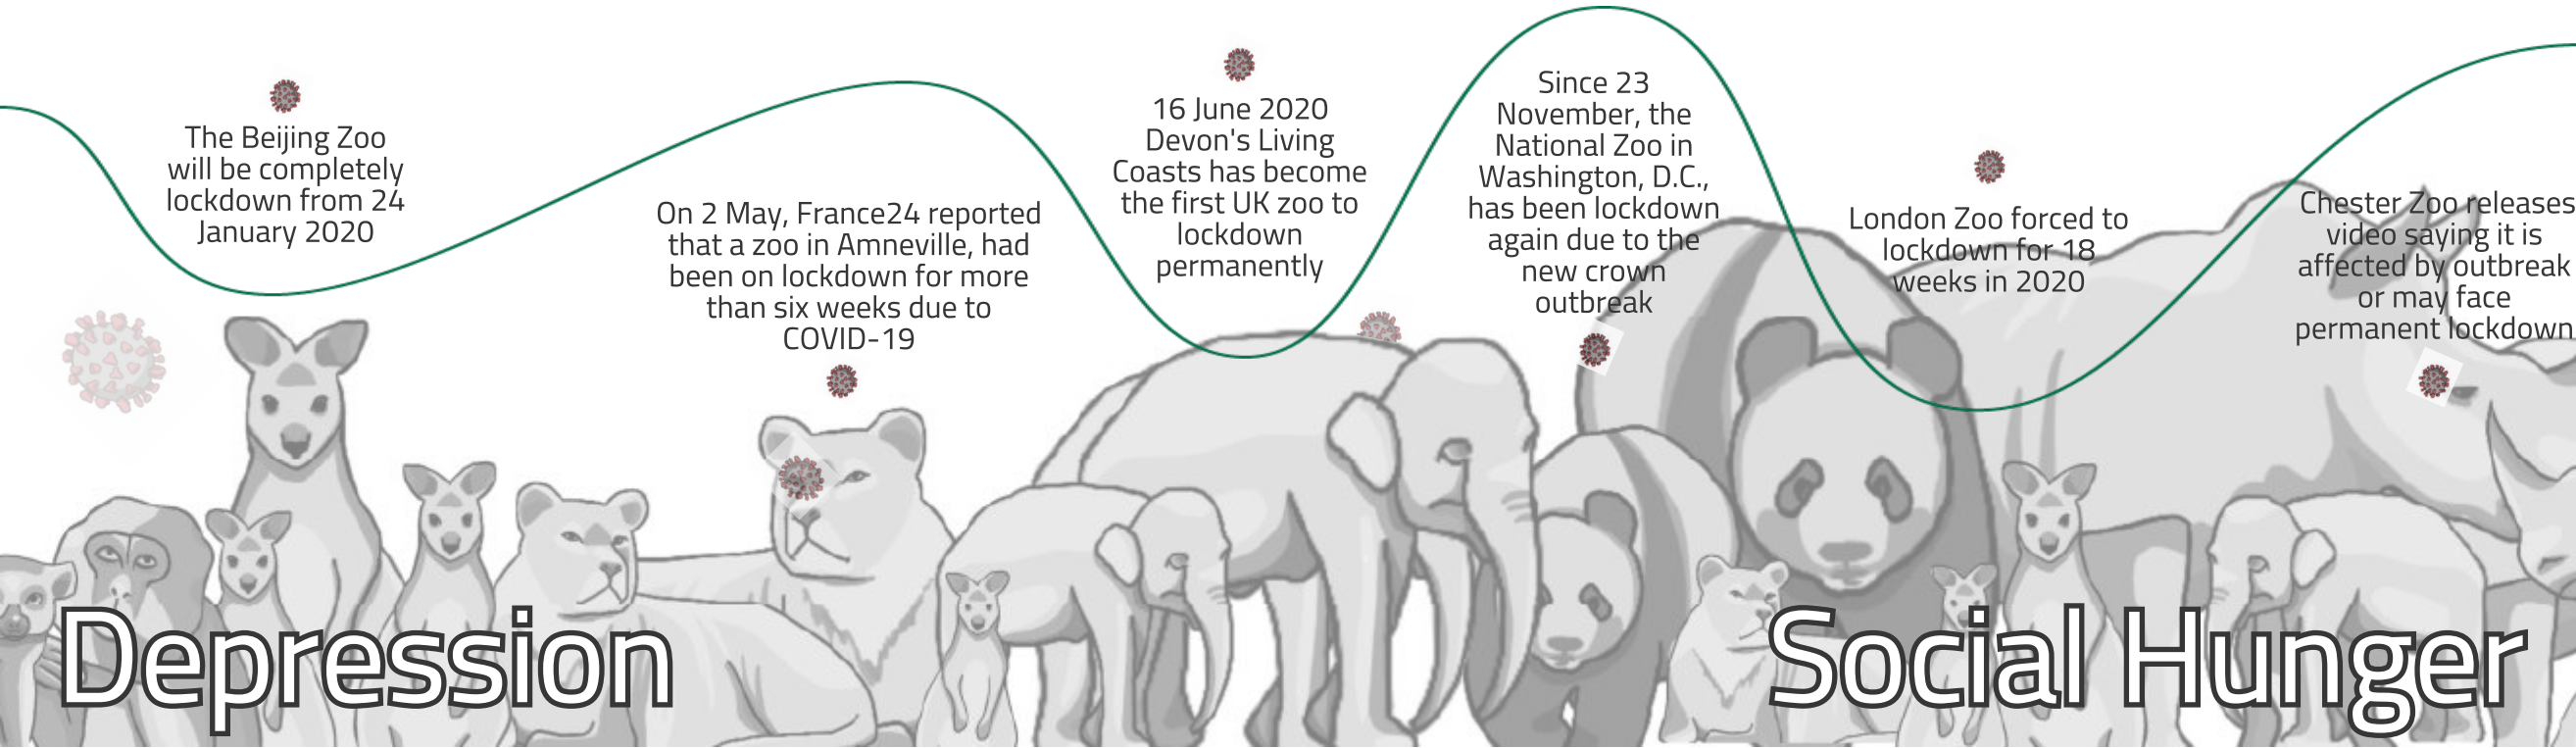

2021 • Individual

Due to the covid-19 lockdown that occurred in many zoos, I have done a lot of research and found that many of the animals were depressed during the lockdown. This project aims to increase animal-human interaction at Chester Zoo and has the potential to help Chester Zoo make up for some of the financial losses caused by the lockdown.

Background

According to Sherwen and Hemsworth (2019), high frequencies of visitor interactions with zoo animals can have a significant positive impact on the quality of life and psychological well-being of the animals. Data collected by testing GC concentrations in faeces, comparative observations between species, etc. showed that the more visitors there were, the more active the animals were. Conversely, the fewer the visitors, the less active the animals, so that during Covid-19 lockdown, animals show 'depression' and 'social hunger'.

Why Chester Zoo

The largest municipal wildlife park in the UK and one of the best in Europe

Animals at Chester Zoo show depression

Closest to my temporary residence, convenient for research

27 miles

Why Lemur

Gentle

Ring-tailed lemurs have a gentle temperament

Group Activities

Ring-tailed lemurs usually like to gather together in groups

High IQ

Ring-tailed lemurs have a high IQ and can interact briefly with humans

More Changes

The change before and after is more pronounced than in other species of animals

Chester Zoo Lemur Pavilion

Living Area

Artificially created drier, rocky open forest environment that mimics the wild environment of the ring-tailed lemurs

Thick branches for the lemurs to climb on

Interactive area

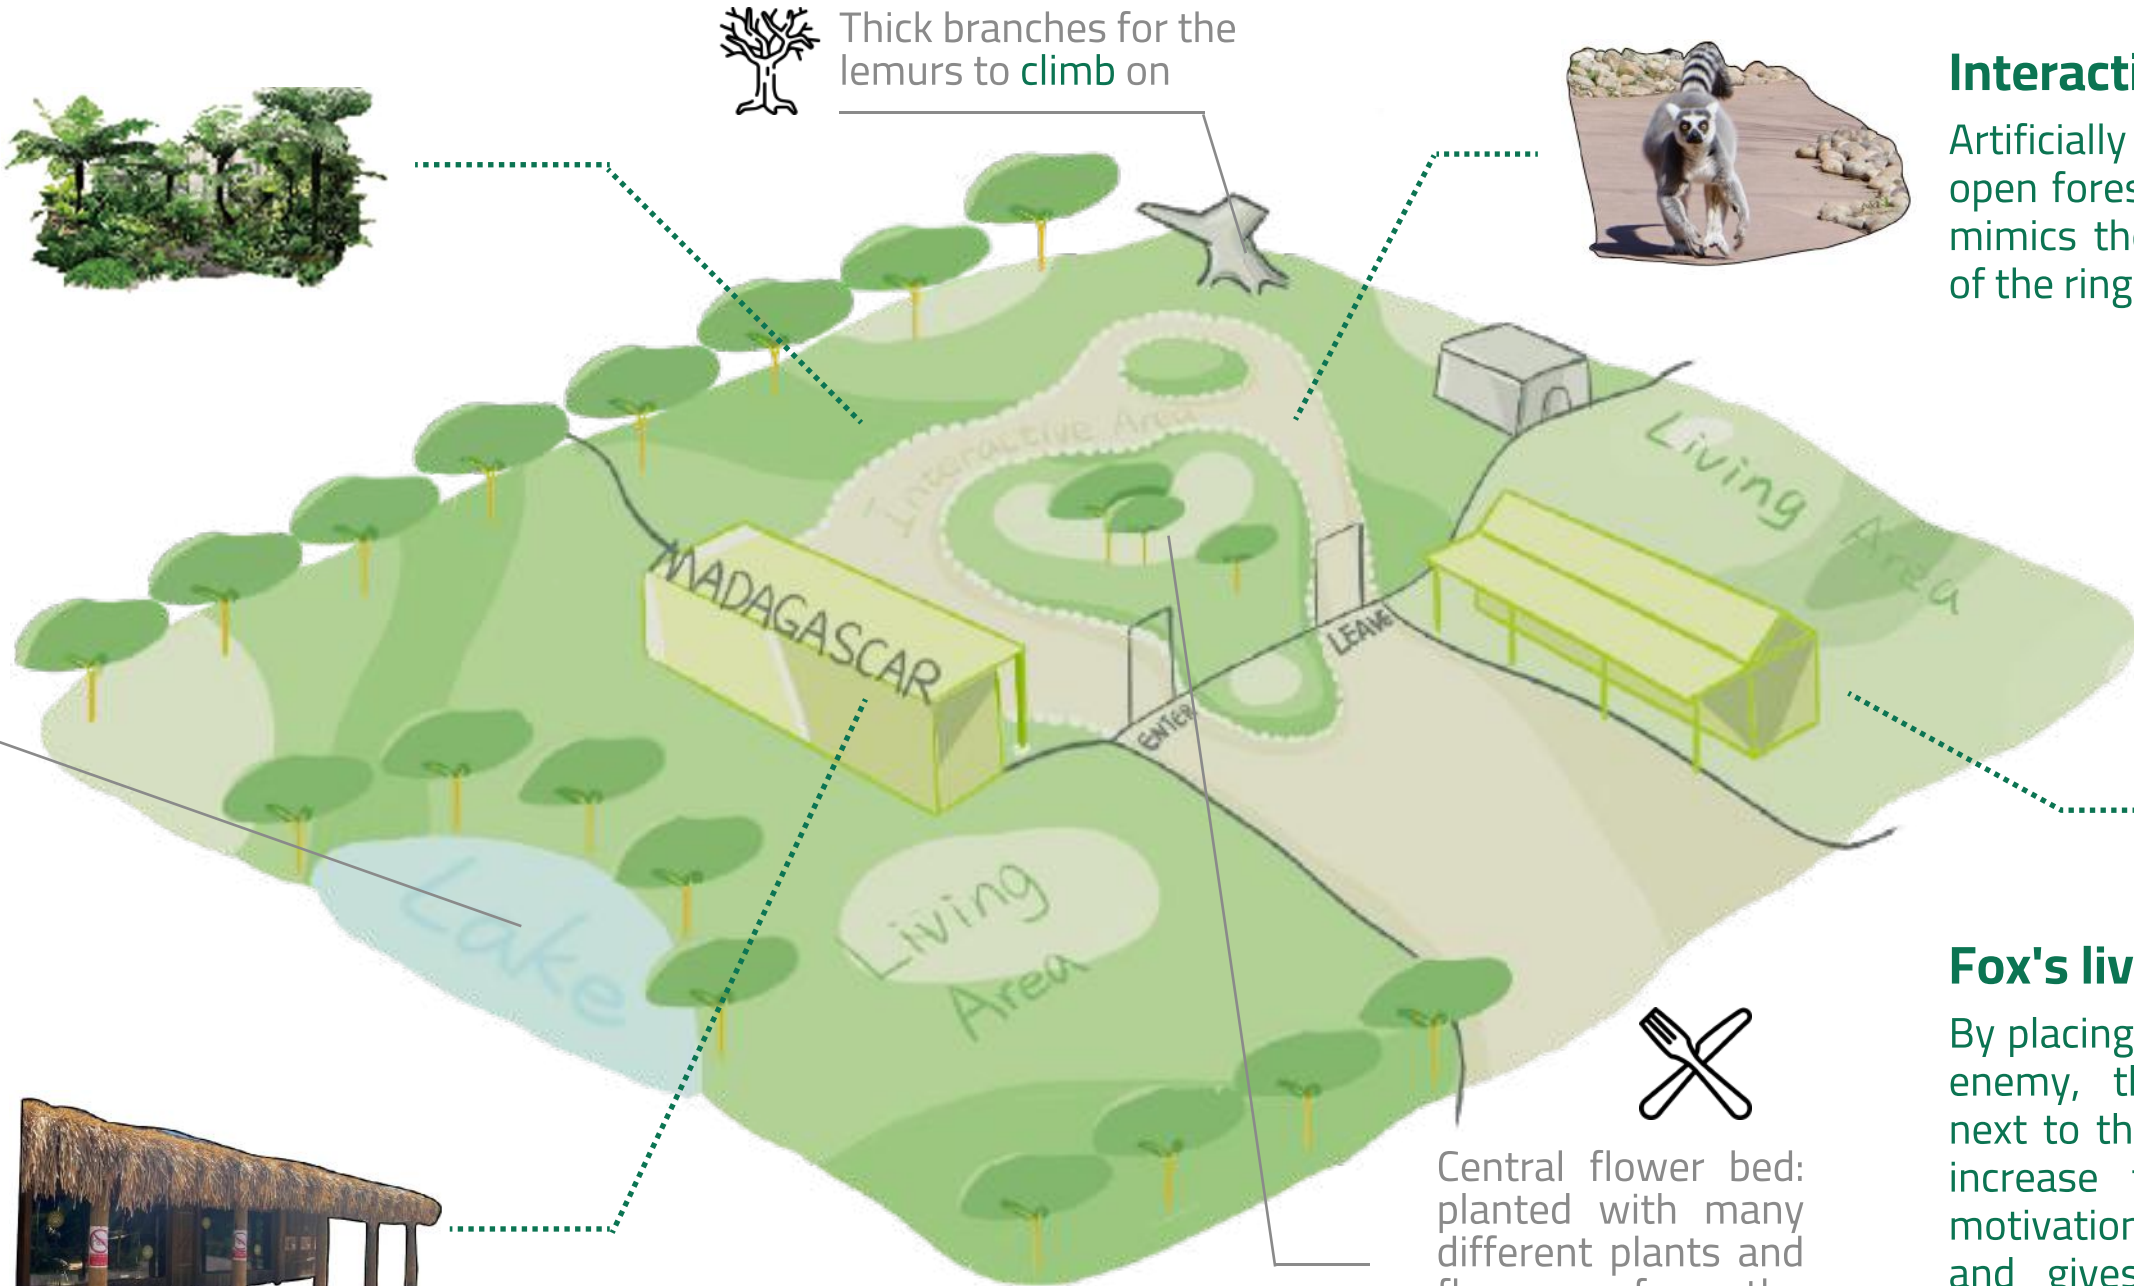

Artificially created drier, rocky open forest environment that mimics the wild environment of the ring-tailed lemurs

The environment in which lemurs live requires water to provide a rich flora

Glass Pavilion

The keepers invite the lemurs into the glass pavilion every day for a rest before the zoo opens so that visitors can see them more clearly. Also use the visitors that come and go outside the glass to increase the activity of the lemurs

Fox's living area

By placing the lemur's natural enemy, the lemur pavilion, next to the lemur, it helps to increase the alertness and motivation of both parties, and gives a more realistic picture of the animals' living environment in the wild

Interview

How do you keep the ring-tailed lemurs active usually?

The keepers hide food for them to find, take them small toys (wooden objects of various shapes) to play with, let them interact and play with other species of lemurs (red-necked lemurs, crowned lemurs), and place their natural enemy arena nearby (but sometimes they are too scared to come out when the lemurs make loud noises).

What do you think about the design of human interaction with ring-tailed lemurs?

Could add more interest but keep a distance as ring-tailed lemurs can carry a transmissible virus and may accidentally scratch humans etc.

Zoo Ranger

John 29

Lemur Feeder

Do ring-tailed lemurs behave unusually during the Covid-19?

Yes, they are more alert than usual, they are not content with getting enough food like other less intelligent animals, they like to have small interactions with humans also they are used to people walking around. During the epidemic, if there is some small movement in the pavilion, they will poke their heads out to see if a visitor has arrived ----- is a sign of loneliness.

" Need to ensure that people and lemurs interact at a safe distance "

About Lemur

About

The ring-tailed lemurs at Chester Zoo

Feeds on leaves, flowers and fruit, as well as insects

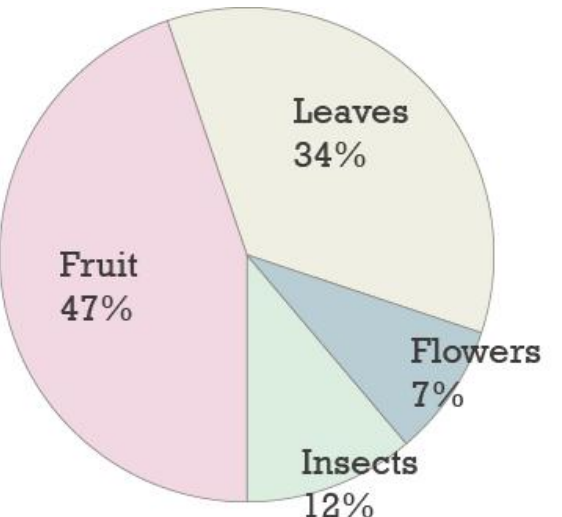

Pain points

When visitors are scarce, their curiosity is not satisfied and their mental state declines, which can affect their health over time

Requirement

They need all sorts of sensory stimulation to stay active, perhaps through various forms of games or interaction with visitors

Timetable of Lemur in Chester Zoo							
		8:00	10:00	12:00	17:00		
Activity		Rest		Glass Pavilion	Being fed	Interactive Area	Rest
Normal							
Covid-19							
Paintpoint		The lack of sunlight in the glass pavilion will lower their mood value	The lemur's condition will slowly decline until it is fed	No visitors in the interactive area, nothing new to satisfy their curiosity	Lemurs tend to be quiet in environments with less daylight		
Opportunity		Using outdoor activities to keep lemurs more active and happy	Food rewards for lemurs through interactive devices to motivate them	Increase interaction between people and lemurs in different regions through screen casting (Incentives to motivate lemurs to interact with visitors on screen)			

Bus stop

Outside facilities need to be placed in public places

Bus stops are heavily trafficked
People stay for 5 to 20 minutes or more
People carry credit cards

Interaction

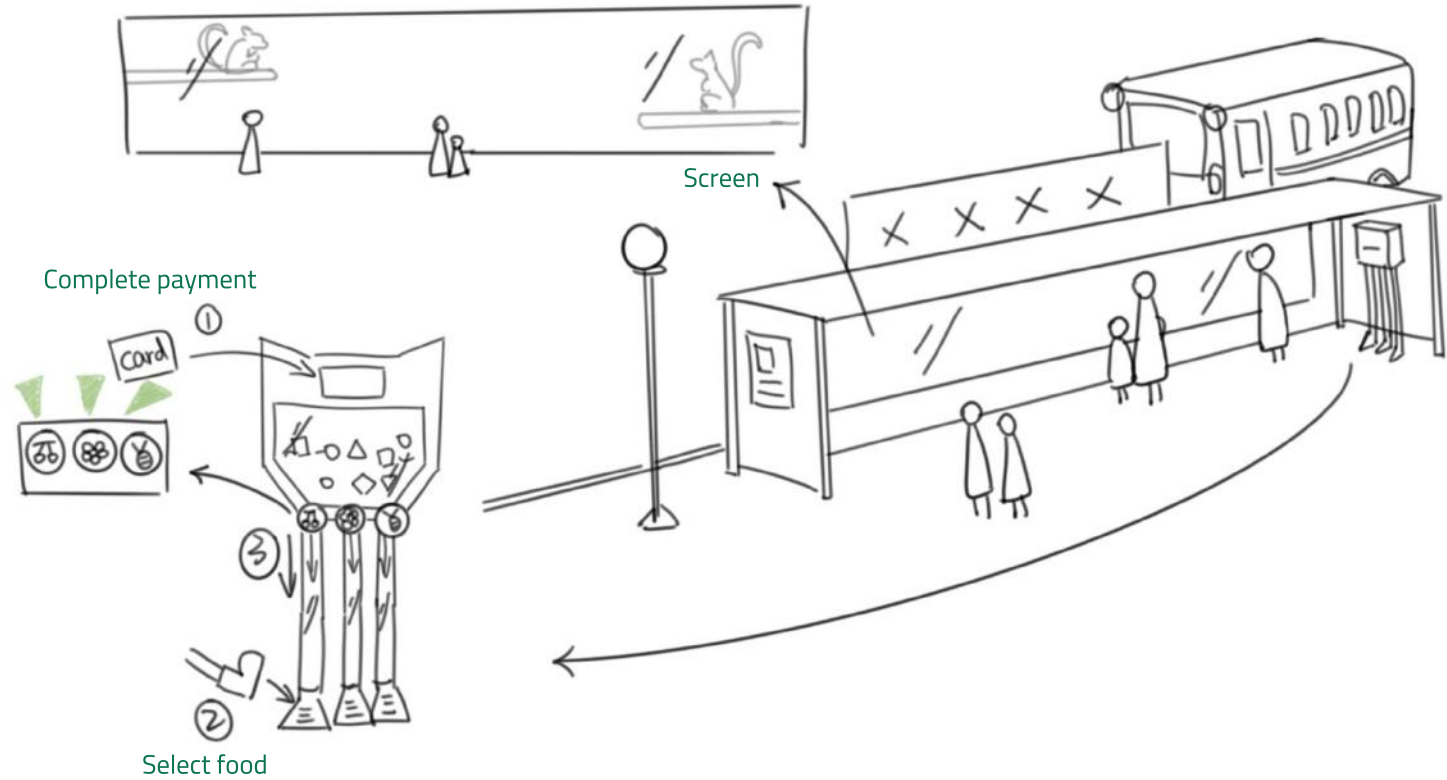

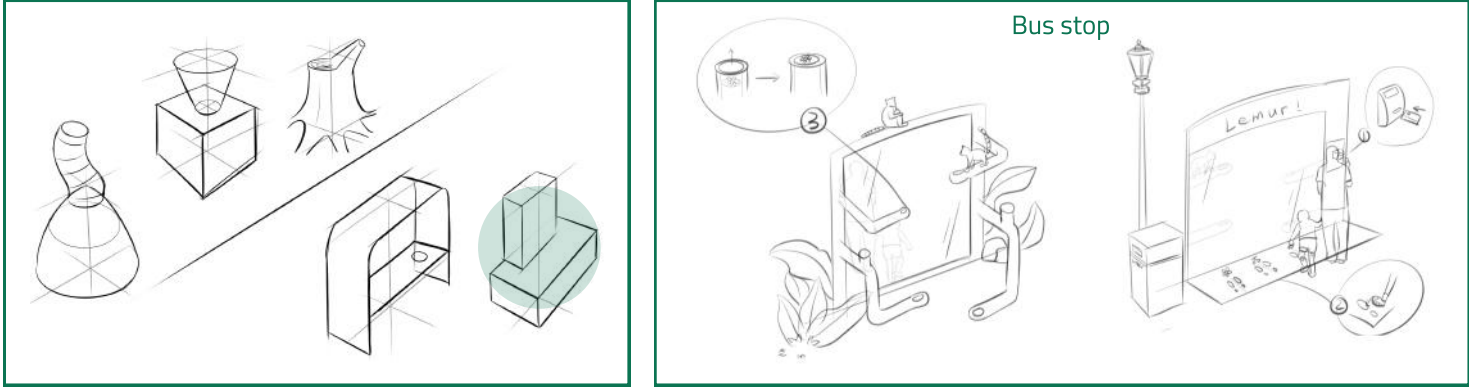

Food Reward

Distance

" The installation outside the zoo can be designed as an integral part of the bus stop "

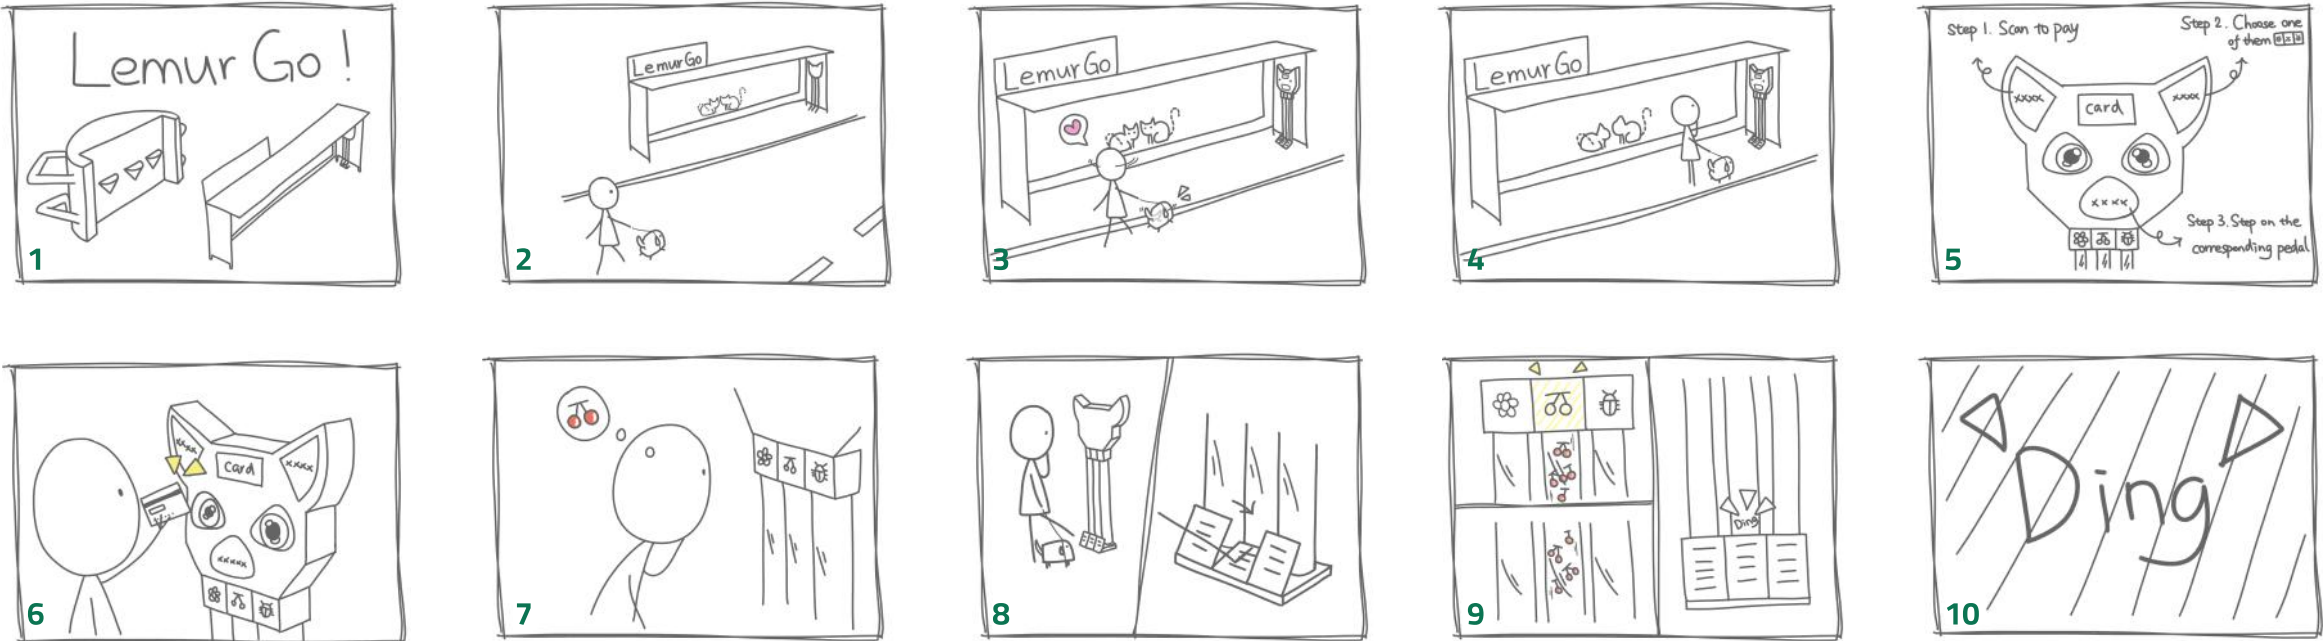

Concept Generation

Design a remote visual feeding device - lemurs and humans interact via a large screen on the device, where humans can purchase prescribed food for the lemurs and feed them during the interaction.

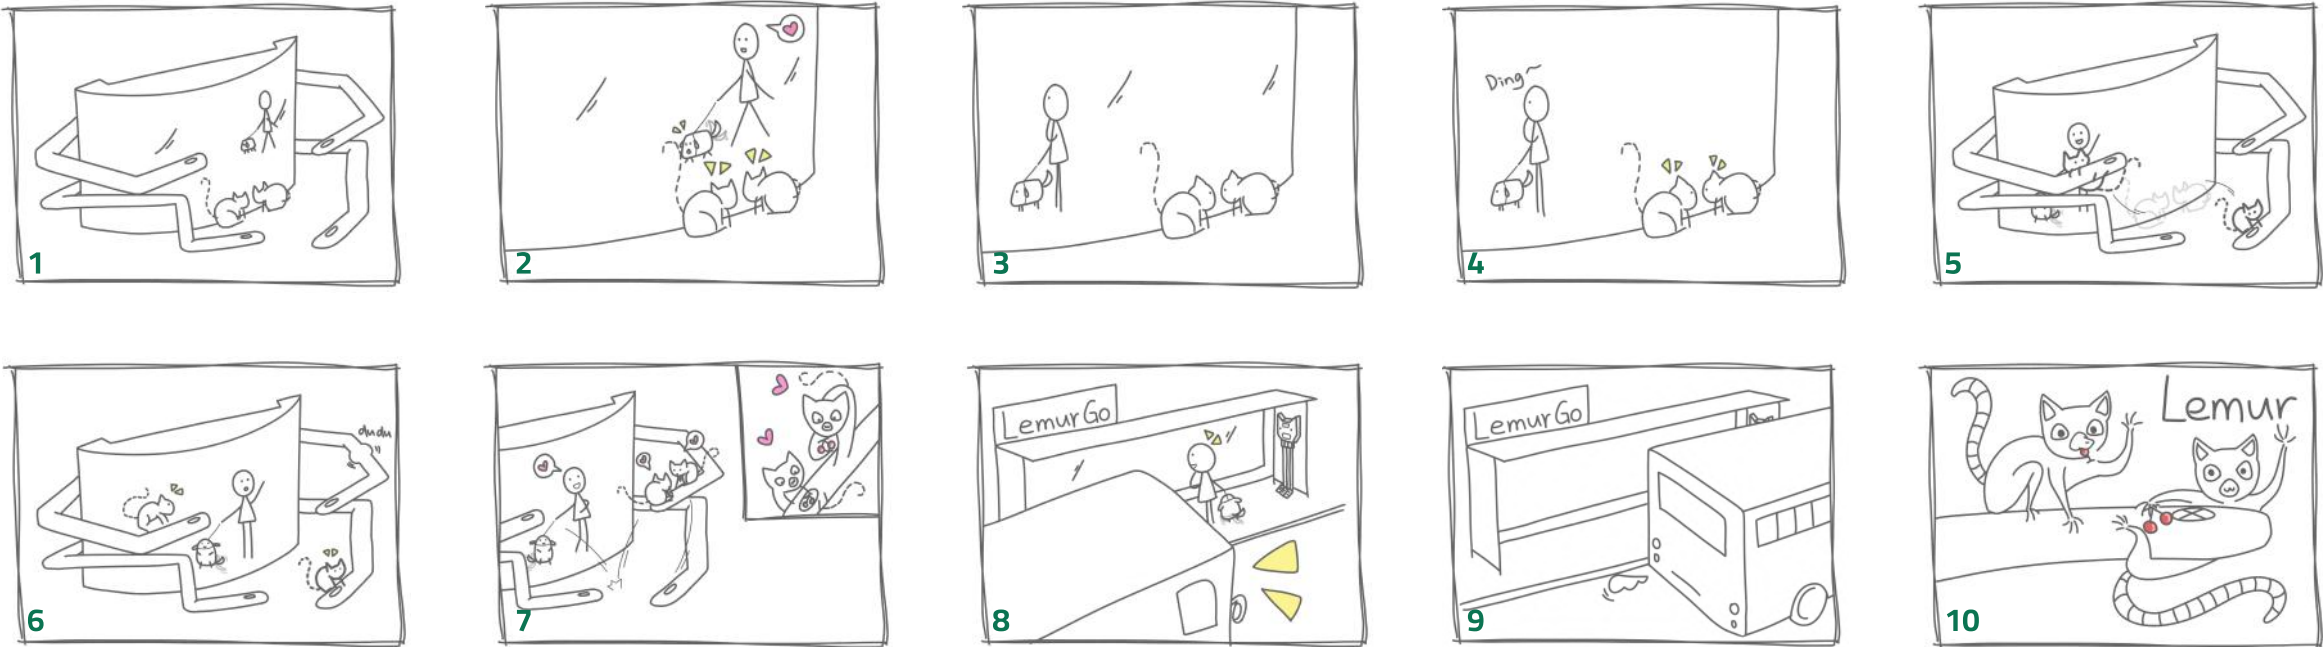

Storyboard

Outside

A man walked to the bus stop and spotted the lemurs on the screen and the feeding machine

Inside

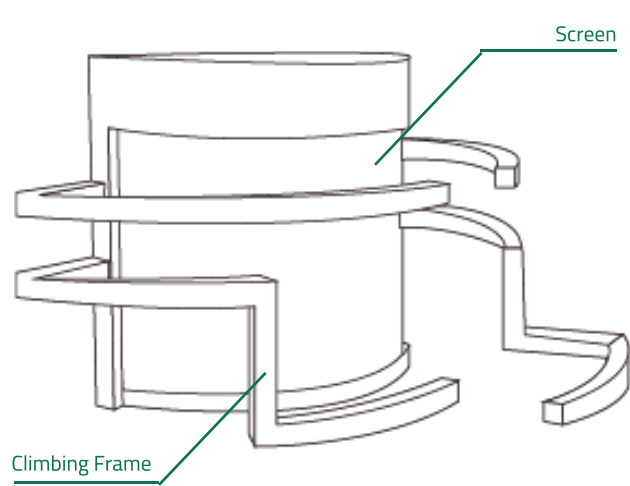

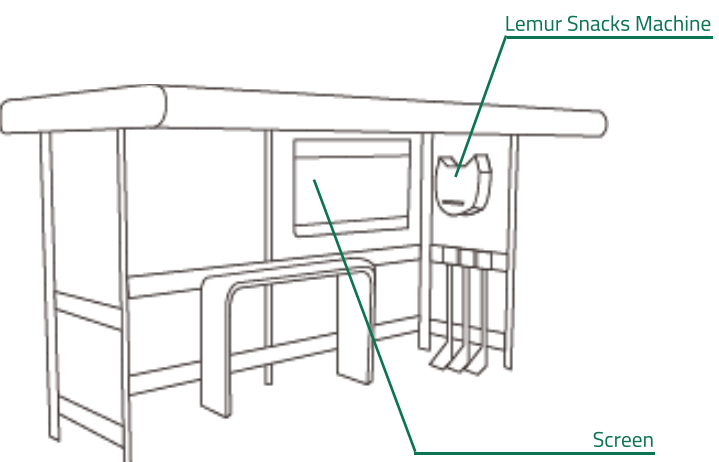

He chose one of the three foods to feed and enjoyed the animated feedback on the machine

Lemurs can see people waiting for the bus through the screen

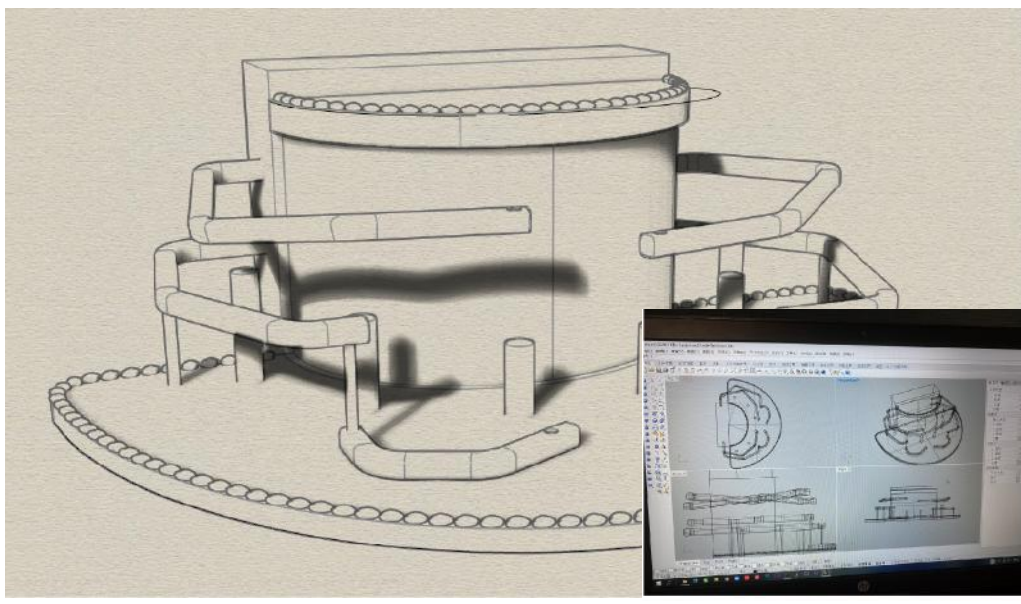

Lemurs will hear sounds and then follow the climbing ladder in search of the food people feed them
